

# Using the DNS[B/W]L checker

The DNS[B/W]L checker checks individual IPs or domains against one or more blacklists.

## Step-by-step guide

1. Go to your InboxSys site. In most cases this is [app.inboxsys.com](http://app.inboxsys.com).
2. Click on the **tool** () symbol and then on **DNS[B/W]L Lookup**.
3. Enter an IP or domain in the top field.

### **i** Did you know...

In the top field you can not only use single IP's and domains, but also **CIDR ranges** and **bracket notation**.

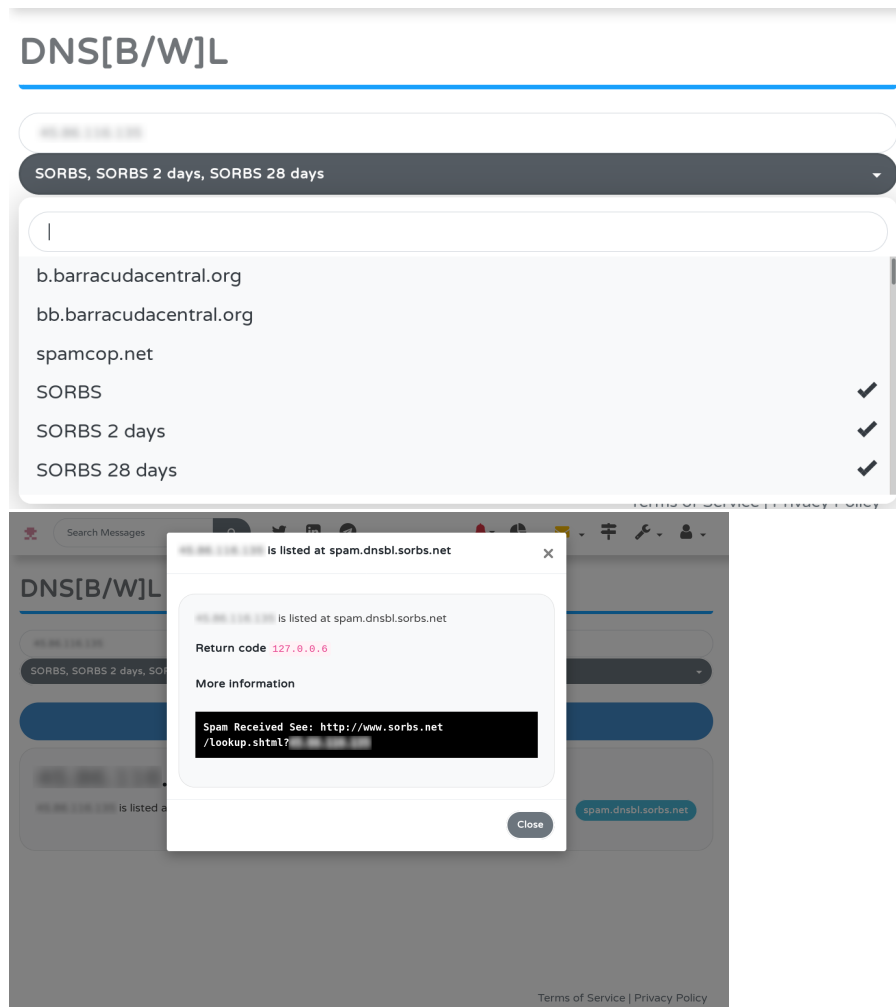

- **CIDR** example: **192.168.32.0/24**.
- **Bracket notation** example: **192.168.32.[1-254]**.

4. Use the dropdown menu to select one or more lists to be checked. If nothing is selected, all lists will be queried.

### **i** Did you know...

The DNS[B/W]L checker can be used **without account login**, but in that case only **the most relevant lists** can be selected from the dropdown menu. To see **all blacklists** active in your account, **log in** and find the full list in the dropdown of the DNS[B/W]L checker.

5. Press **Check!**
